Common Review Questions and Answers in Weather and Climate

Q1: What causes the difference between weather and climate?
Answer: The primary cause of the difference lies in the time scale and variability. Weather is influenced by short-term atmospheric conditions, such as pressure systems, fronts, and local factors, leading to daily or hourly changes. Climate, on the other hand, results from the long-term averages of these weather patterns, reflecting regional characteristics over decades and centuries.

Q2: How does latitude affect climate?
Answer: Latitude determines the angle and intensity of sunlight received at a location, influencing temperature and climate. Areas near the equator (low latitudes) receive more direct sunlight year-round, leading to warmer climates. Conversely, regions closer to the poles (high latitudes) receive less solar energy, resulting in colder climates. This variation explains the distribution of tropical, temperate, and polar zones.
